Warrants | Description

What are warrants?

Warrants offer investors the chance to benefit at a disproportionate degree (leveraged) from the performance of the underlying instrument. The investment in warrants requires less capital outlay than the direct investment in the underlying. Shares, currencies, interest rates, or commodities among others, can serve as underlying.

Warrants transfer the right to the holder to buy (call options) or sell (put options) a specified amount of the underlying instrument during (American) or at the end of the life (European) of the warrant at a fixed price. The holder may exercise this right, but does not have to do so. In practice, the holder will tend not to exercise the right but to sell the warrant on the stock exchange or settle in cash. This is easier and more economical.

The price of a warrant is composed of the intrinsic value and the time value. The difference between the price of the underlying and the strike price is equal to the intrinsic value. At the end of its life, the warrant expires and becomes worthless if the intrinsic value is zero or negative. The time value represents a sort of premium and depends on numerous factors. The remaining life of the warrant is a crucial factor. The longer it is, the higher is the probability that the underlying will rise (relevant for call options) or fall (relevant for put options), which in turn results in a higher time value. The time value decreases over the life of the warrant, and it does so more rapidly towards the end of the life than at the beginning. In addition, factors like interest rates, dividends (if the underlying is a share), and the volatility of the underlying affect the time value.

How do put options work?

Holders of a put option expect the price of the underlying instrument to fall. They acquire the right to sell the underlying, and in return they pay the so-called option premium. It makes economic sense to exercise the right when the underlying can be sold through the option at a higher price than on the stock exchange. For most put options, however, the underlying instrument is actually never physically sold and delivered; rather, settlement is in cash. This means that the value of the option is credited to the investor's account.

Investors benefit from falling prices in the underlying. If the underlying records a positive performance, the maximum loss the investor will incur is the option premium he/she paid (i.e. total loss).

A put option allows investors to achieve gains amid falling prices of the underlying instrument as well as to hedge their portfolio against declines in that underlying. Seeing that the value of a put option increases as the price of the underlying falls, in an ideal case the option can offset the possible losses of the underlying in the portfolio.

Secondary market

From the value date onwards the certificates can be traded on each stock exchange day during trading hours. However, Erste Group Bank AG cannot guarantee the existence or maintenance of an active market throughout the entire life of the certificate. The issuer will, as a rule, continuously quote prices, but is not obligated to do so. Neither is the issuer obligated to redeem the certificates. During the life of the certificate its price will be significantly determined by the general development of interest rates, the fluctuations on the capital market, and the general economic scenario.
